NORTHERN

PROJECT AREA

PROJECT GOALS

- I. Find out levels of Arsenic, Lead, and Manganese in Environmental Samples from 3 Chapters for one year
- 2. Understand Human Exposure to the Spill
 - Household Environmental Samples for Arsenic and Lead
 - Personal Samples of Urine for Arsenic and Blood Lead tests
 - Sheep and Corn Samples for Arsenic and Lead
- 3. Survey what people think about risk from the Spill and report back measured risks

GOAL 1: ENVIRONMENTAL SAMPLES

20 SAMPLES AT EACH CHAPTER

- River Water
- River Sediment Core

- Agricultural Soil
 - -Grab & Core
- Irrigation Water
- Irrigation Sediment Core

ENVIRONMENTAL SAMPLES COLLECTED

- I. Nov 2015
 - I 62 soil/sediment
 - -62 water
- 2. March 2016
 - -183 soil/sediment
 - -37 water
- 3. June 2016
 - -213 soil/sediment-201 water
- UA, NAU, & Diné College
- 858 samples total

WATER STATUS

• Total of 288 water samples collected

	by month				
Sample Type	Nov.	March	June		
Irrigation canal water	17	10	59		
River water	38	31	109		
Well water	12	0	12		
Total by Month	67	41	180		

Number of complex

WATER GUIDELINES: DRINKING WATER FOR PEOPLE

- US EPA Primary Maximum Contaminant Level (MCL)
 - The maximum amount of a contaminant allowed in drinking water so that it is still safe for people to drink over many years
- US EPA Secondary MCL
 - The suggested maximum amount of a contaminant in drinking water so the water does not have bad taste, smell, or color
 - Not related to human health or safety
- Both set by the US Environmental Protection Agency

WATER GUIDELINES: PLANTS AND ANIMALS IN WATER

- NOAA SQuiRTs (Screening Quick Reference Tables)
 - The maximum amount of a contaminant allowed in water so it is safe for plants and animals to live in over many years
 - Used by the National Oceanic and Atmospheric Administration (NOAA)
 - Based on levels set by the US EPA and other organizations

OUR MAIN FINDINGS

- Amounts of **arsenic** in water were below the guidelines for drinking water for people and for plants and animals living in water
- Amount of **lead** in 4 river samples was above the water guideline for plants and animals living in water in Spring 2016
- Amounts of **manganese** were above both guidelines in Spring 2016 more than Winter 2015 and Summer 2016
- Amounts of metals in the San Juan River and canal water were generally higher in Spring 2016 compared to Winter 2015 and Summer 2016

GOAL 2: HOUSEHOLD SAMPLING

<u>Aug 8-12, 2016</u>

- ✓ Worked with Navajo CHRS
- ✓ Took drinking <u>water</u>, <u>dust wipe</u> and <u>soil</u> samples
- ✓ Collected <u>urine</u> samples
- ✓ Measured lead levels in <u>blood</u> using a portable machine and a finger stick
- Administered questionnaire and food recall <u>survey</u>
- ✓ Story in Navajo Times

 \rightarrow Will deliver results in Summer 2017 to participants, then community

Gold King Mine Spill Dine' Exposure Project

GOLD KING MINE SPILL EXPOSURE AND RISK PERCEPTION STUDY

SEEKING FOCUS GROUP PARTICIPANTS

What is a focus group? A focus group consists of 10 individuals who have an in-depth discussion about the Gold King Mine Spill in Navajo and English.

How many focus groups will there be? There will be 4 focus groups of 10 people in each of the three communities.

Who are we? A team of professors with expertise in hydrology, exposure, health, and indigenous studies from the University of Arizona, and Northern Arizona University led by Dr. Karletta Chief.

What we are studying? The short-term exposure and risk perception of of Navajos living in Upper Fruitland, Shiprock and Aneth on the Navajo Nation who were impacted by the Gold King Mine Spill. We would like to understand community concerns about the various exposure pathways by which an individual can be exposed to metals released by the Gold King Mine Spill.

Who can participate? A Navajo community member from the Aneth, Upper Fruitland, or Shiprock communities who wish to share their experience around the spill.

Your privacy will be protected and your name and identity will not be released at any time during the study.

(Food Loss)					

Number of references

SHIPROCK VISIONS

- Utilize the Navajo Agricultural Products Industry (NAPI) Cutter Dam water
- Pursue compensation to assist with costs to haul water or to use "drip water" temporarily
- Pursue sustainable alternatives like hydroponic farming, solar power to clean the water, and reverse osmosis or "Brita" filtering systems
- Need for a unified "voice" among the community

SHIPROCK CONCERNS

- Personal and family health: Will eating the crops cause them health problems? Will letting their grandchildren play in the field make them ill?
- Community health: Will selling their crops "poison" others?
- Birth defects
- Cancer
- Mental health
- Animal and livestock health: Will eating their sheep make them ill?

SHIPROCK DISTRUST

- The City of Farmington has previously dumped sewage waste in the river
- The federal government has "lied" about uranium and fertilizer safety in the past
- The Environmental Protection Agency (EPA) has not taken responsibility for the spill
- The Navajo Nation government has previously supported fossil fuel industries and has not spent money from the multimillion dollar settlement towards spill clean-up

SHIPROCK CULTURAL CONCERNS

- Loss of community identity since they can no longer farm
- Damaged community reputation due to spill (no one will buy crops from them)
- Community is conflicted on next steps (increased tension)
- The next generation will not be able to farm (disruption to K'e and community farming culture)
- People have stopped using the river to harvest tadidiin and to wash off after sweat lodge
- Behavioral health programs have stopped taking kids to the river to discuss cultural teachings

SHIPROCK FARMING CHANGES

- Did not farm after the spill (loss of income)
- Farmed less land (loss of income)
- Farmed for family (not to sell)
- Hauled water or used tap water

SHIPROCK ENVIRO. CONCERNS

- Concern about heavy metals still in sediment
- EPA representative said on the news that the water is still contaminated
- ASU professor said water will "not be good for a decade"
- Concerns about long-term presence of contaminants in the sediment and the canals
- Rain brings "grey" water, is there sediment with heavy metals in there?

PROJECTED TIMELINE FOR GIVING RESULTS TO COMMUNITY

SPRING 2017

SUMMER 2017

• **April** – Environmental Water Results

• July – Environmental Soil/Sediment Results

• August – Household Results (Individuals) FALL 2017

•Sept. – Household Results (Community) •Oct. – Focus Group Results

OUR MAIN FINDINGS

- Amounts of **arsenic** in water were below the guidelines for drinking water for people and for plants and animals living in water
- Amount of **lead** in 4 river samples was above the water guideline for plants and animals living in water in Spring 2016
- Amounts of **manganese** were above both guidelines in Spring 2016 more than Winter 2015 and Summer 2016
- Amounts of metals in the San Juan River and canal water were generally higher in Spring 2016 compared to Winter 2015 and Summer 2016

CONCLUSIONS

- Environmental Sampling We completed water testing for Arsenic, Lead, and Manganese. We are working on soil/sediment analysis and aim to complete by July 2017.
- Household Sampling We are putting findings into a computer and will give back findings to participants in August 2017 and then to the community in September 2017.
- Focus Groups We translated content from Diné'ke'jí to English and analyzing what people said.
 We will give back findings to the community in October 2017.
