

# **Selected results from Air Quality Research in the Carlsbad, NM, area**

**New Mexico Radioactive and Hazardous Materials Committee  
meeting, September 13, 2024**

**Detlev Helmig, Boulder AIR  
Gunnar W. Schade, Department of Atmospheric Sciences, Texas A&M University**

# Study Objectives

Our study is designed to better understand emissions and population exposure to air pollutants coming from Unconventional Oil and Gas Development (UOGD)

- 1) Use fixed-placed, active air quality monitoring to characterize the emissions and impacts from UOGD (stationary trailer)
- 2) Use distributed, passive sampling to understand the potentially uneven distribution of selected toxic air pollutants (volunteer-driven)
- 3) Focus on UOGD related flaring by combining our measured data with satellite observations

# Study Objectives

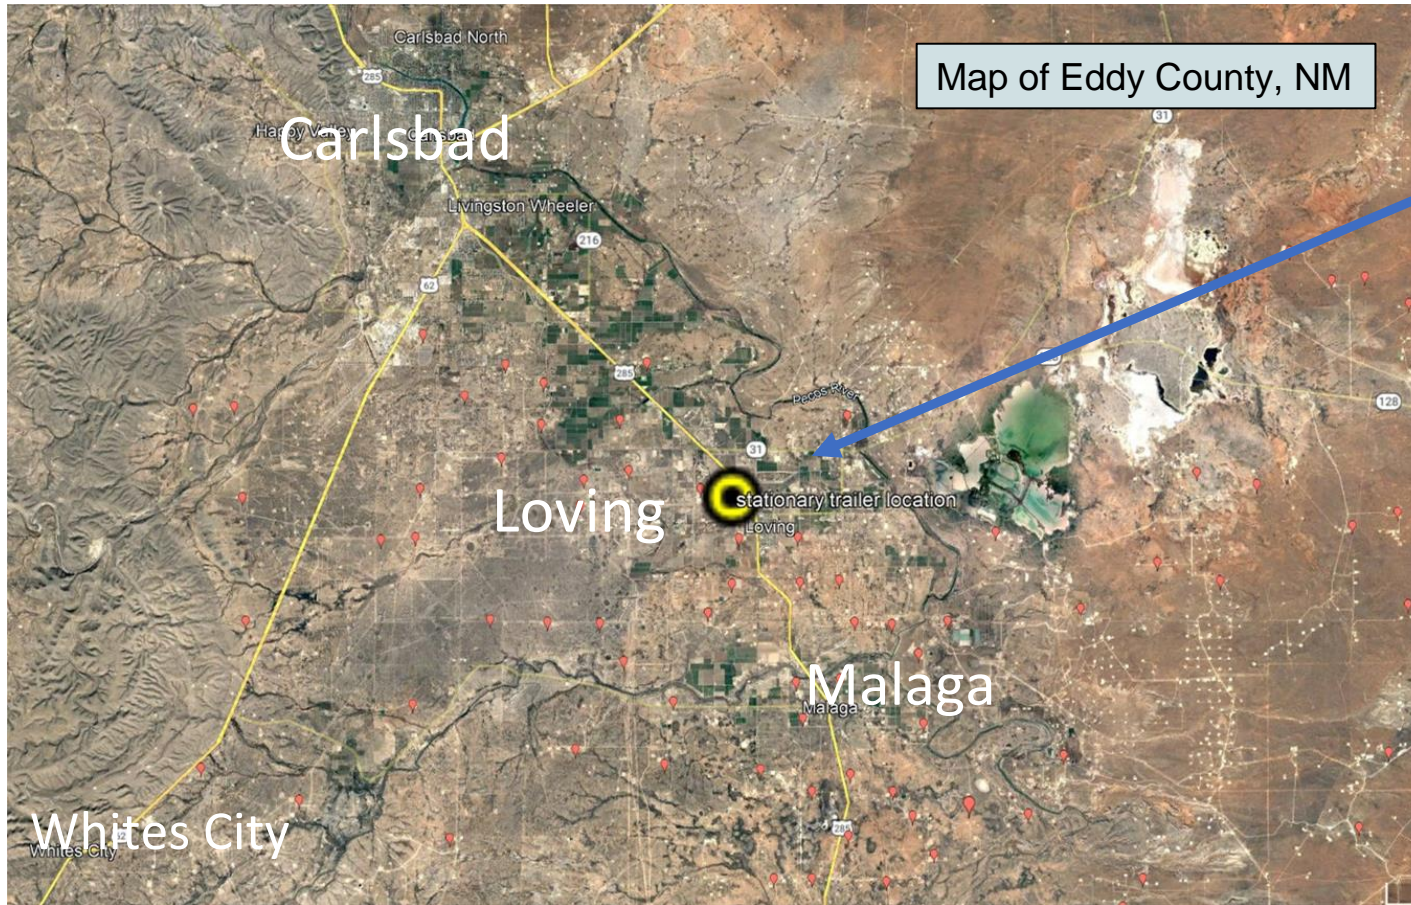

Our study is designed to better understand emissions and population exposure to air pollutants and noise coming from Unconventional Oil and Gas Development (UOGD)

1) Use fixed-placed, active air quality monitoring to characterize the emissions and impacts from UOGD (stationary trailer)

2) Use distributed, passive sampling to understand the potentially uneven distribution of selected toxic air pollutants (volunteer-driven)

3) Focus on UOGD related flaring by combining our measured data with satellite observations

(currently suspended)

# *Overview of stationary monitoring*

- ❖ One year duration, started in April 2023
- ❖ Highly sensitive, regulatory rated instruments and protocols
- ❖ Fully automated, 24/7 operations
- ❖ Most extensive (# of monitored pollutants, # of measurements) air monitoring in New Mexico

# What we are measuring in Loving, NM

## Air Pollutants and Greenhouse Gases

- *Ozone (O<sub>3</sub>)*
- Volatile organic compounds (VOCs), 24 species, incl. *ethane*, propane, ... acetylene, BTEX, ....
- Nitrogen Oxides (NO<sub>x</sub>)
- Sulfur Dioxide (SO<sub>2</sub>)
- Hydrogen Sulfide (H<sub>2</sub>S)
- Carbon Monoxide (CO)
- *Methane (CH<sub>4</sub>)*
- Carbon Dioxide (CO<sub>2</sub>)

## Radioactivity

- *Radon (Gas)*
- *Radon decay products (Particles)*

## Noise

- Decibel levels at different frequencies

### Ozone forms from:

- VOCs as the fuel
- NO<sub>x</sub> as the catalyst
- Sunlight as the driver

image credit: NASA/NSF

# Ozone

# Ozone at the Loving, NM site

Ozone levels exceeded the U.S. EPA 8-hour NAAQS\* of **70 ppb** on **31 of 155** days in 2023.

(Exceedances so far have occurred on 40 days in 2024)

Similar exceedances have been observed for several years at Carlsbad Caverns.

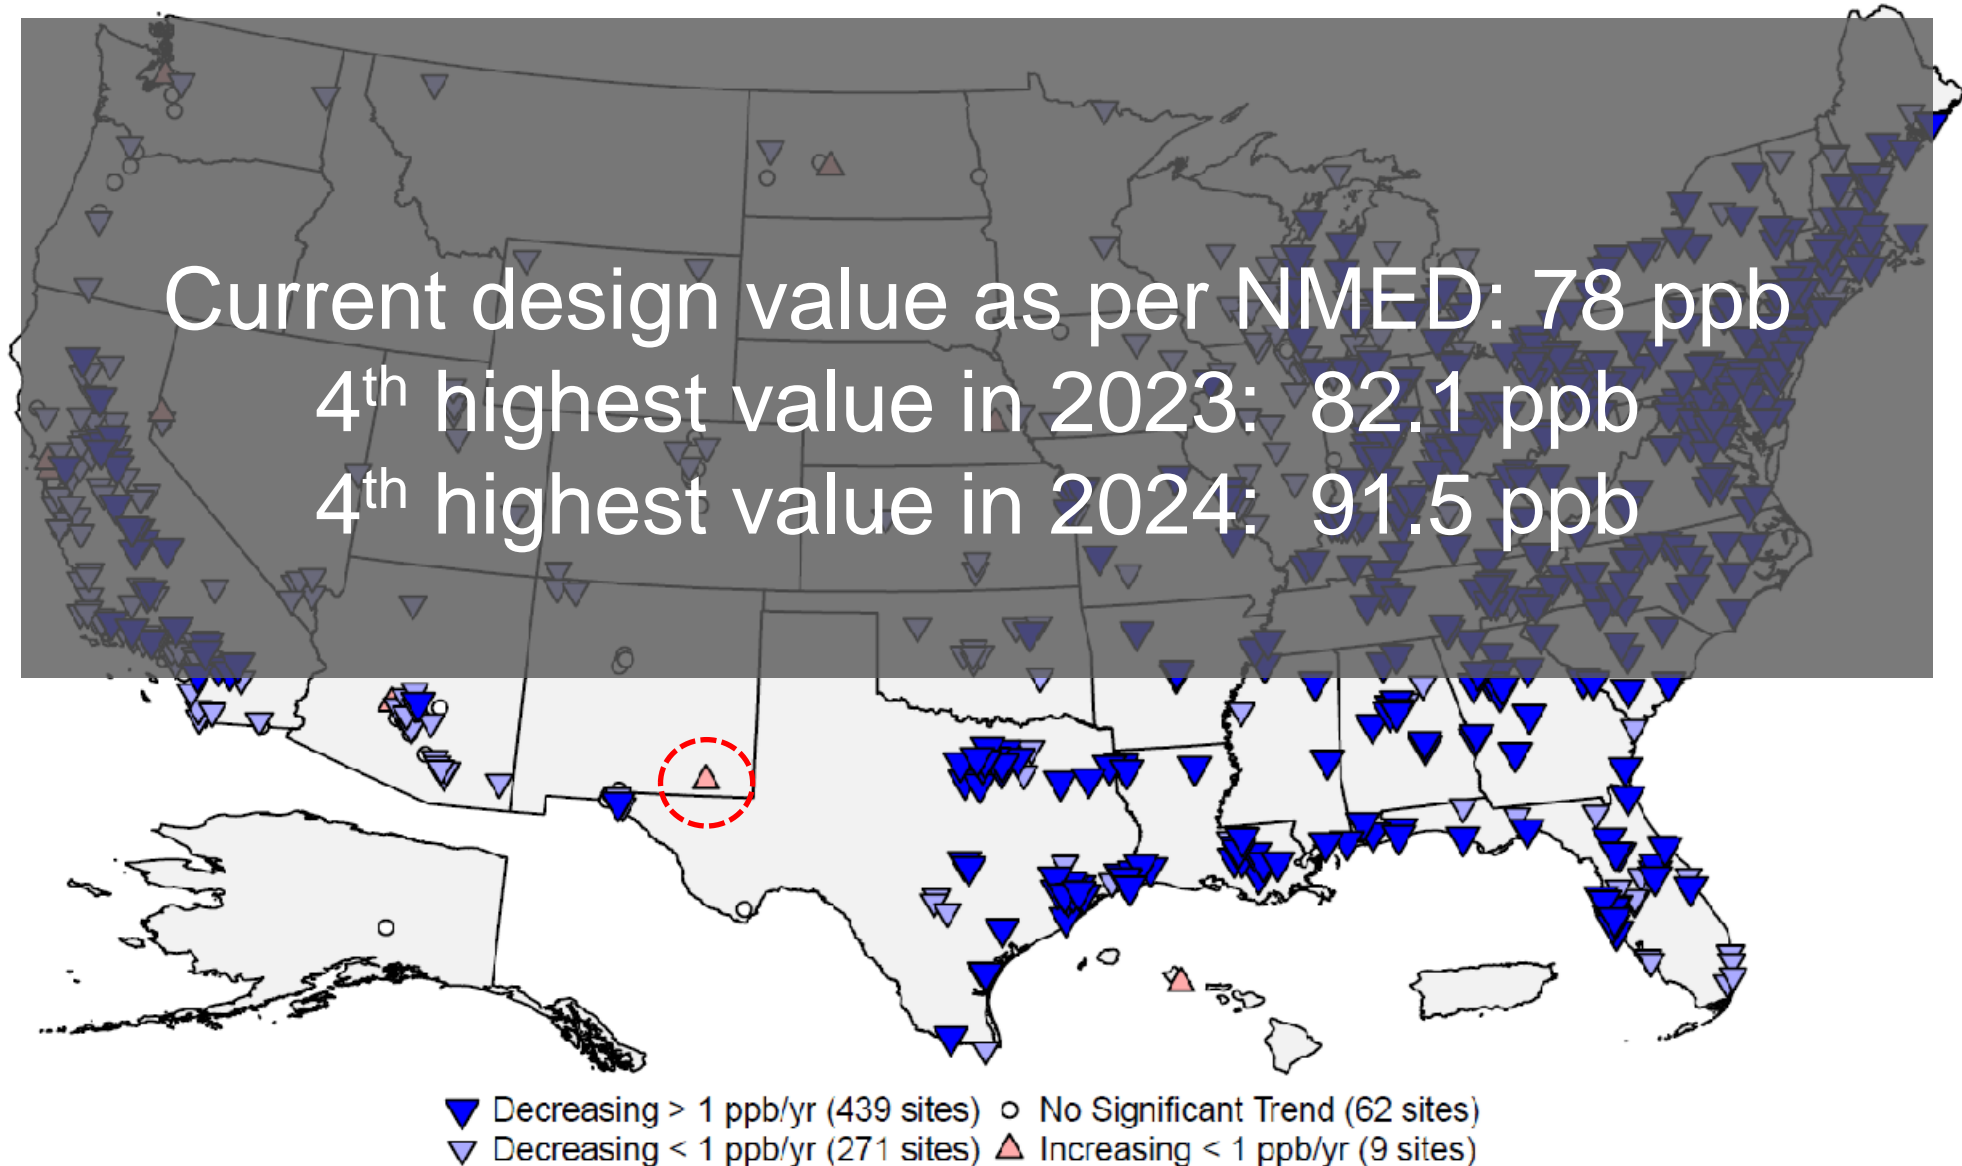

\* NAAQS = National Ambient Air Quality Standard

## 8-hour running mean ozone

# Methane at Loving, NM, compared to CO sites

Methane is a potent GHG, contributing one third to global warming from all well-mixed GHG emissions. Its dominant emissions in SE NM are from the oil and gas industry, manifesting in high concentration plumes.

# Methane at Loving, NM, compared to CO sites

# Methane at Loving, NM, compared to CO sites

# Ethane at Loving, NM, compared to CO sites

## Volatile Organic Compounds

The very high similarity between ethane and methane variations and abundances in SE NM confirms their origins in oil and gas industry activity emissions.

# Bertin Technologies AlphaGUARD DF2000 + AlphaPM

**AlphaGUARD DF2000** Radon gas alpha decay

Detector: Ionization chamber  
Range: <math><0.05\text{ pCi/L}</math> to 54,000 pCi/L (2 to 2,000,000 Bq/m<sup>3</sup>)  
Flow rate 0.05 – 0.5, 1, 2 L/min; 620 mL chamber volume  
1 min or **10 min** measurement cycle  
5-year calibration factor, traceable

**AlphaPM** Radon progeny on PM alpha decay

Detector: Semiconductor (PIPS)  
Range: 0.5 to 1,000,000 Bq/m<sup>3</sup> EEC (0.02 to 35,000 MeV/cm<sup>3</sup>)  
Lower detection limit at 10 min and 2 L/min flow: 2 Bq/m<sup>3</sup> EEC (0.07 MeV/cm<sup>3</sup>)  
Flow rate 0.1, 0.5, 1.0, 1.5, 2.0 L/min  
**10 min** measurement cycle, synchronized automatically with connected AlphaGUARD

# Units for Ambient Radioactivity Monitoring

- Pico-Curie per Liter :  $\text{pCi L}^{-1}$
  - **Becquerel per cubic meter:  $\text{Bq m}^{-3}$**
- 1 pCi L<sup>-1</sup> is equivalent to 37 Bq m<sup>-3</sup>**
- Continental background, outdoor air: **5-15 Bq/m<sup>3</sup>** (0.135-0.405 pCi/L)
  - World Health Organization action level for indoor air: **100 Bq/m<sup>3</sup>** (2.7 pCi/L)
  - US EPA action level for indoor air: **4 pCi/L (~150 Bq/m<sup>3</sup>)**

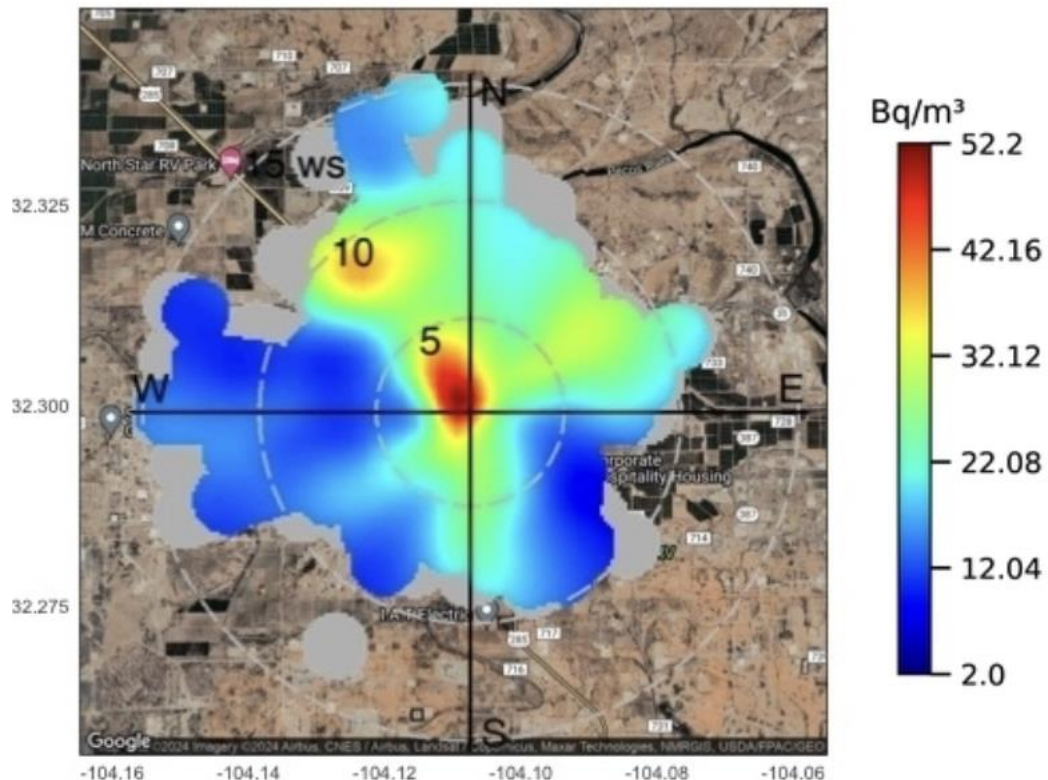

# New insights from airborne radioactivity measurements

Loving New Mexico

Gas + Particle Radiation Oct 01, 2023, to Dec 31, 2023

Minimum bin value = 2

Wind speeds larger than 1 m/s

**Radioactive Radon is a gas and Radon decay products are on particles**

Radon emanation is enhanced as it is brought to the surface via drilling and gas production

- Elevated levels (yellow to red colors) are detected from various directions, especially under moderate northerly, especially NNW wind directions.
- Under these conditions, levels are on average 2-3 times higher than background\* levels (cyan and blue colors).
- Correlation with sulfur compounds may suggest a shared “sour gas” source.

# Conclusions

- Implemented air monitoring in Loving, NM, in April 2023.
  - Operated continuously with less than 2% downtime since.
- Eddy County has been exceeding the NAAQS threshold since 2018 but has not yet been designated as out of compliance under the Clean Air Act
  - more 2023 ozone exceedances than comparison sites in CO also affected by oil & gas emissions and in counties in *serious* non-attainment status for the ozone NAAQS
  - Comparing our data with other monitoring results suggests that ozone pollution levels are increasing, defying trends seen in most of the USA (EPA, 2023).
  - Our data, and several prior peer-reviewed studies, suggest the regional ozone problem is largely due to NO<sub>x</sub> and VOC emissions from oil and gas industry operations.
- This study identified enhanced local Radon emissions that result in elevated levels of airborne radioactivity.
